

Linear Gradients

How do CSS linear gradients work? Let's take a look in this lesson.

In very simple terms, a linear gradient is a gradient that fades from one color to another **over a line**.

Here's what I mean:

The image is a gradient from **red** to **black**

The Most Basic Syntax

Let's say you wanted a linear-gradient from red to yellow, how would you do that?

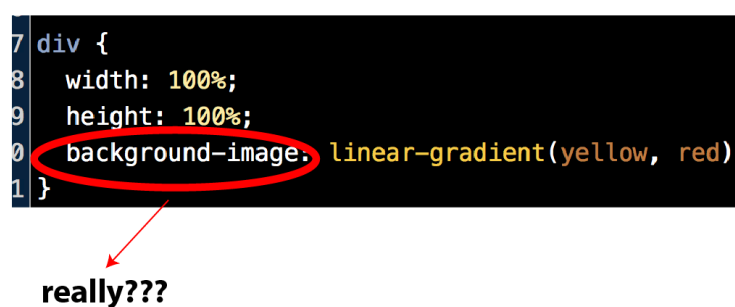

Simple.

```
div {  
  background-image: linear-gradient(yellow, red)  
}
```

Here's the result of that:

Did you take a look at the property name in the code above?

background-image???

I'll explain this in the next lesson. Before that, give the `body` element a gradient from `pink` to `orange` in the playground below. Don't skip this!

css

body {
width: 100px;
height: 100px;
}

body {
/*write your CSS here*/
}

output

Done with the exercise?
