

Solution Review: Implement a Calculator Class

This review provides a detailed analysis to solve the 'Implement a Calculator Class' challenge.

We'll cover the following ^

- Solution
- Explanation

Solution

```
1 class Calculator {
2
3     // Class fields
4     private double num1;
5     private double num2;
6
7     // Default Constructor
8     public Calculator(double num1, double num2) {
9         this.num1 = num1;
10        this.num2 = num2;
11    }
12
13    // Addition Method
14    double add() {
15        return this.num1 + this.num2;
16    }
17
18    // Subtraction Method
19    double subtract() {
20        return this.num1 - this.num2;
21    }
22
23    // Multiplication Method
24    double multiply() {
25        return this.num1 * this.num2;
26    }
27
28    // Division Method
29    double divide() {
30        return this.num1 / this.num2;
31    }
```

Explanation

- We have implemented the `Calculator` class which has the data members `num1` and `num2`.
 - In the constructor, initialized both variables to **`num1`** and **`num2`**
 - Implemented `add()`, a *method* which returns the addition of two numbers i.e. $num1 + num2$
 - Implemented `Subtract()`, a *method* which returns the subtraction two numbers i.e. $num1 - num2$
 - Implemented `multiply()`, a *method* which returns the multiplication of two numbers i.e. $num1 * num2$
 - Implemented `divide()`, a *method* which returns the division of two numbers i.e. $num1 / num2$
-
