

# Who This Course is for?

This course is for people who are comfortable with one programming language at least and want to learn web development

## We'll cover the following

- How to get the most out of this course?

This course is for anyone who knows the basics of programming and wants to get into web development in some capacity but is not sure where to start. You don't have to have a degree or any kind of official background in computer science to get started with this.

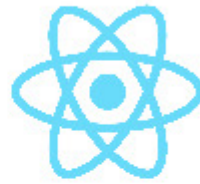

You should, however, know what variables are, how to declare them, how to write for-loops, and how to write functions. If you know an object-oriented language such as Java or C++, however, that would make learning web development easier for you, but it is not a prerequisite.

## How to get the most out of this course? #

Everything in this course is made as simple as possible and described as if to someone who is completely new to the topic. So if you are familiar with something, feel free to jump straight to the quiz on it (if it exists in that lesson) or skipping it entirely.

Also, you can use this course as a reference guide. So if you are getting started with a certain technology and want to touch upon its background, you can always come back to it.

# The "I'm a web developer" starter pack

---

Enough introductions, let's dive into the course!
