Monospace, Cursive and Fantasy

In this lesson we will take a look at the css font families, Monospace, Cursive and Fantasy, with examples!

Monospace

A monospaced font is also called a **fixed-width** font. The widths of the characters are fixed!

Best use: In standard body texts, they aren't very good. They are harder to read and take up more horizontal space. In the dev world, they are famously used for **code blocks**

monospace

Cursive

Cursive fonts are also called script fonts. They are representational of

handwriting - this isn't always the case though.

Hello World

cursive

Fantasy

Fantasy fonts are primarily decorative fonts that contain playful representations of characters. Sounds like fun, huh?
