Monolith & Microservices Quiz

This lesson contains a quiz to test your understanding of monoliths and microservices.

Let's Test Your Understanding Of Monolithic & Microservices architecture

1 When should we use a monolithic architecture for our project? Which of the following option(s) are correct?

A) When our project requirements are pretty simple, the application is expected to handle a limited amount of traffic, for instance, an internal tax calculation app for an organization or a similar public tool.

B) When the entire backend of the project can be easily implemented with a single technology. When we do not need to leverage heterogenous technologies for our project.

C) When we expect an exponential growth in the traffic on the app, right after launch & we need to scale fast.
